CloudGuard IoT — System Analysis & Design

Stakeholder Analysis

Status: Initial Baseline **Version:** 1.0 **Target:** Cloud & IoT Security Platform

1. Purpose

This document identifies the individuals and groups that influence the project or utilize its outputs, summarizing their interests, needs, and expected level of engagement.

2. Stakeholder Register

Stakeholder	Role / Interest	Main Needs	Influence	Engagement
DEPI Evaluator	Reviews scope, design, implementation & outcomes	Clear requirements, justified design decisions, evidence of testing	High	Review milestones & feedback
Project Team	Analyze, design, implement, test, and document	Clear task ownership, stable requirements, reproducible setup	High	Regular syncs & code reviews
Project Lead	Coordinates timeline, risks, and deliverables	Milestone visibility, progress tracking, blocker escalation	High	Maintain task board & dependencies
Security Operator	Reviews findings and investigates incidents	Prioritized alerts, explainable risk scores, incident timeline	Med–High	Validate use cases & dashboard
Cloud Admin	Manages cloud test resources & permissions	Least privilege, clear resource boundaries, safe containment	Med–High	Review cloud permissions
IoT Admin	Registers and manages test IoT devices	Device identity, status, clear isolation & restoration procedure	Medium	Validate device lifecycle
Demonstrator	Views project during evaluation	Clear dashboard, understandable incident flow, repeatable demo	Medium	Usability review
AWS Lab Owner	Provides/controls test environment	Cost control, authorized use, resource cleanup, safety	High	Approve resources & cleanup
System Owner	Potential future adoption/extension	Maintainability, auditability, reliability, secure config	Low	Feedback for future roadmap

3. Primary User Needs

Security Operator (Primary Persona):

- See active incidents and their corresponding severity levels.
- Understand why an event received a particular risk score through transparent indicators.
- Identify affected devices and cloud resources quickly.
- Review incident timelines and response outcomes.
- Distinguish detected, investigating, contained, resolved, and false-positive incidents.

Cloud & IoT Administrators:

- See which cloud resources are within the designated monitoring scope.
- Understand permissions required by monitoring and response components.
- Identify registered test devices, review identity configurations, and spot abnormal behaviors.
- Isolate and restore test entities using a controlled, auditable process.

Instructor / Evaluator:

- Understand the problem statement, objectives, scope, and technical architecture.
- Trace requirements directly to implemented features and verified test cases.
- Observe a repeatable end-to-end demonstration with honest reporting of limits.

4. Stakeholder Prioritization

The instructor, project team, and AWS lab owner require the closest engagement as they directly influence project acceptance, implementation velocity, and infrastructure safety. Security and cloud/IoT administrators serve as the core functional personas for validating platform workflows.

5. Communication and Feedback Plan

- **Planning:** Align on scope, objectives, and task allocation with the team and instructor.
- **Design Review:** Validate requirements and architectural diagrams prior to active development.
- **Implementation:** Track progress, blockers, and code reviews using GitHub Issues.
- **Testing & Final Presentation:** Share test reports, run live repeatable demonstrations, and document lessons learned. All scope decisions will be recorded in the project repository.
